

KanakkuKural

Speak your entries. See
your next move.

A phone-first AI cash-flow copilot for small
merchants.

Target Audience

Built for merchants who run their business from their phone

- ➔ **Target users** include a vast network of small business operators: local grocery shops, traditional kirana stores, independent local retailers, home-based businesses, and small-scale wholesalers.
- ➔ For these merchants, the smartphone is already the central hub of their daily operations, but their financial data remains **highly fragmented**. Daily records consist of a chaotic mix of physical supplier bills, loose cash transactions, digital UPI receipts from various payment apps, and informal customer credit agreements, requiring constant mental gymnastics.
- ➔ By focusing on a **phone-first architecture**, we are meeting the merchant exactly where they are, utilizing the hardware they already own to streamline the complex reality of micro-retail cash flow management.

Paper bills, fragmented records, uncertain decisions

- ➔ **First**, supplier bills and traditional handwritten khata (ledger) records remain stubbornly on paper, making them difficult to search, track, or analyze over time.
- ➔ **Second**, cash transactions and digital UPI entries are tracked in completely separate silos, preventing a unified view of daily income.
- ➔ **Third**, short-term customer credit is frequently remembered rather than formally recorded, leading to lost revenue and strained relationships.

Operational Impact

Because of these disconnected systems, a busy merchant has no single, consolidated view of today's money.

The critical records exist in the physical space or in isolated apps, but the overarching financial decision remains completely unclear, forcing merchants to operate on intuition rather than data.

"Can I safely pay my supplier tomorrow?"

Every day, a merchant faces a critical **decision gap** and needs a fast, accurate answer to a fundamental question: *Is there enough money available to cover upcoming obligations?* They must constantly evaluate which customer payments are still pending, which supplier bills are due next, and whether they should pay a vendor now, collect outstanding debts first, or wait for more daily sales. This **mental calculus is exhausting** and prone to error, especially during peak business hours.

KanakkuKural bridges this gap by turning scattered, multi-format information into one clear, actionable next step. By synthesizing pending payables and receivables, the assistant removes the guesswork from daily cash flow management and empowers the merchant to make **confident financial commitments**.

One phone turns messy records into a next action

STEP 1: SCAN BILL

First, the merchant uses the camera to scan a physical supplier bill.

STEP 2: SPEAK/VOICE ENTRY

Second, they can speak or type a transaction using natural language. Third, the app automatically builds a private, local ledger on the device.

STEP 3: DECIDE

Fourth, it generates a rolling seven-day cash forecast based on recorded data. Finally, it delivers a clear Pay, Collect, or Wait recommendation.

INTEGRATED SMARTPHONE AI COMPONENTS

This is powered by **three core AI components** optimized for the smartphone: **on-device Optical Character Recognition (OCR)** for instant bill parsing, **advanced Voice-to-transaction conversion** for hands-free entry, and a **specialized local cash-flow decision engine** that processes data without compromising user privacy or requiring constant cloud connectivity.

Intelligent bill scan and OCR

The first core capability is frictionless data capture. The merchant simply uses their phone camera to scan a physical supplier bill.

Our intelligent on-device OCR instantly extracts critical data points: the **Supplier name**, the total **Bill amount**, the **Bill date**, the **Due date**, and the expense **Category**.

To ensure complete accuracy and build user trust, all extracted fields are fully editable before being saved to the local ledger.

Voice-First Transaction Entry

To accommodate the fast-paced environment of a retail shop, KanakkuKural features a voice-first transaction entry system. Merchants can speak naturally, saying phrases like, "**Ravi paid ₹450 by UPI.**"

AI Natural Language Parser (NLP)

Customer	Amount	Type	Date
Ravi	₹450	UPI Received	Today

Designed with a **bilingual UI supporting both English and Tamil**, KanakkuKural ensures complete accessibility for local merchants who are uncomfortable with English-only typing interfaces.

The hands-free transaction parser includes a manual override for instant corrections, dramatically reducing the friction of logging daily sales and credit settlements.

Private on-device ledger

LEDGER DATA CATEGORIES

KanakkuKural comprehensively logs and tracks small business transactions offline directly on local storage:

- ➔ **Cash Tracking:** Logs all cash received and spent instantaneously.
- ➔ **UPI Records & Dues:** Monitors UPI transactions and supplier bills offline.
- ➔ **Customer Credit:** Manages credit issued and payments collected.
- ➔ **Upcoming Expenses:** Outlines future budget planning steps natively.

LOCAL ONLY STORAGE

All business records remain strictly on-device, utilizing local storage rather than cloud databases. This architecture guarantees maximum merchant data privacy and seamless offline utility.

NO BANK INTEGRATION

Requires absolutely no bank account access and holds zero capabilities to initiate payments. Merchants can trust the application as an insulated, risk-free planning assistant.

Seven-day cash-flow forecast

Predictive Intelligence

Synthesizing Multiple Data Streams

The true power of KanakkuKural lies in its **predictive capabilities**. The application generates a dynamic seven-day cash-flow forecast by synthesizing multiple data streams.

It combines the **current available cash on hand**, **expected customer credit repayments**, **projected UPI and cash income trends**, **pending supplier bills**, routine expenses, and **upcoming due dates**. By analyzing these factors, the app provides a clear, highly visual projection of **what funds can safely be spent over the next week**.

This forward-looking visibility transforms the merchant from being reactive to proactive, allowing them to manage their working capital with unprecedented precision and avoid unexpected cash shortages.

Pay, Collect, or Wait

The Culmination of App Intelligence: The Decision Engine

Select any supplier bill and ask natural questions like "Can I pay Amma Foods ₹1,800 on Friday?" The engine runs live forecast analyses to deliver definitive, liquidity-preserving recommendations.

DECISION 01

SAFE TO PAY

"Safe to Pay: You can pay ₹1,800 on Friday. Your projected balance after payment is ₹3,200."

DECISION 02

COLLECT FIRST

If cash is tight, the engine advises calling in pending customer credit before releasing this payment to the supplier.

DECISION 03

WAIT

Recommends delaying payment due to a projected low cash balance, protecting your vital operational liquidity.

A Complete Merchant Workflow on the iQOO Phone

LIVE DEMO CONCLUSION

This demo proves the **end-to-end utility** without requiring any payment initiation or bank access.

Built for the Red Light and Green Light format

GREEN LIGHT PRIORITIES

Focus on core functionality: building the essential Android screens, integrating the OCR and voice input APIs, developing the local ledger and cash-flow logic, and rigorously debugging the final demo flow.

RED LIGHT PRIORITIES

Involve essential testing and validation: ensuring a flawless phone-first experience on the iQOO test device, validating fallback flows if bill scans or voice entries fail, and refining the UI and demo pitch.

SATURDAY CHECKPOINT

Critical Target: Have the bill scan, transaction entry, and the Pay/Collect/Wait recommendation engine running smoothly on the physical device.

Empowering Merchants with Intelligent Control

Through **KanakkuKural's predictive decision engine**, shop owners transition from purely reactive bookkeeping to proactive strategic financial management on their physical iQOO devices.

1

Flawless UI Integration

A responsive, mobile-first design adapted perfectly for iQOO's high-performance hardware, ensuring smooth tactile interactions during daily checkout workflows.

2

Local Privacy First

All ledger updates, OCR scans, and voice commands process entirely on the device, safeguarding merchant financial privacy without requiring external banking integrations.

3

Smarter Decisions

The dynamic seven-day cash-flow forecast provides unambiguous advice: pay suppliers immediately, coordinate credit collection first, or securely preserve liquidity.
